

Inverses of Functions

Objective

- To be able to find inverses of functions.

Warm Up: Graph & give the
domain & range.

$$f(x) = \begin{cases} x+5, & x < -3 \\ -2, & -3 < x < 1 \\ x-4, & x \geq 1 \end{cases}$$

Answer on Next Slide

Warm Up #3: Graph & give the domain & range.

$$f(x) = \begin{cases} x+5, & x < -3 \\ -2, & -3 < x < 1 \\ x-4, & x \geq 1 \end{cases}$$

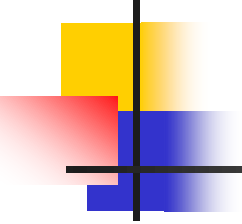

x	y
-3	2
-4	1
-5	0

x	y
1	-3
2	-2
3	-1
4	0

$$D : (-\infty, -3) \cup (-3, \infty)$$

$$R : (-\infty, -\infty)$$

- 
-
- If f is a function from a to b , $f(a) = b$ we write $f: a \rightarrow b$. We say that f maps a to b
 - If f is a function from x to y , $f(x) = y$ we write $f: x \rightarrow y$. We say that f maps x to y

- 
-
- If $g(x) = x^2 + 9x - 5$ we write

$$g: x \rightarrow x^2 + 9x - 5$$

- If $f(x) = 4x^2 - x$ we write

$$f: x \rightarrow 4x^2 - x$$

- If $f(x) = 17$ we write

$$f: x \rightarrow 17$$

- 
-
- If $l(x) = \cos(x)$ we write

$$l : x \rightarrow \cos(x)$$

- If $f(3x) = 4x^2$ we write

$$f : 3x \rightarrow 4x^2$$

- If $f : x \rightarrow 1/x$ we write

$$f(x) = 1/x$$

Vertical Line Test

- Recall that a **function** passes the vertical line test.

Vertical Line Test

- Used to determine if a graph is a function.
- If a vertical line intersects the graph at more than one point, then the graph is **NOT** a function.

NOT a Function

Is it a function? Give the domain and range.

FUNCTION

Domain : $[-4, 2]$

Range : $[-4, 4]$

Give the Domain and Range.

Domain : $x \geq 1$

Range : $y \geq 2$

Domain : $-2 \leq x \leq 2$

Range : $0 \leq y \leq 3$

Polynomial Functions

Definition of a Polynomial Function

Polynomial Function

A **polynomial function of degree n** is defined by

$$f(x) = a_n x^n + a_{n-1} x^{n-1} + \cdots + a_1 x + a_0,$$

for real numbers a_n, a_{n-1}, \dots, a_1 , and a_0 , where $a_n \neq 0$ and n is a whole number.

Identifying Polynomial Functions

Circle only the polynomial functions.

$$f(x) = x^2 + 3x + 2$$

$$f(x) = \sqrt{x^5} + 3x^2 + 6$$

$$f(x) = \frac{3}{4}x^3 + 9x^2 + 10x$$

$$y = 2$$

$$y = \frac{3x^2 + 6x + 10}{2x}$$

Polynomial Functions

EXAMPLE

Evaluating Polynomial Functions

Let $f(x) = 4x^3 - 5x^2 + 7$. Find each value.

(b) $f(-3)$

$$f(x) = 4x^3 - 5x^2 + 7$$

$$f(-3) = 4 \cdot (-3)^3 - 5 \cdot (-3)^2 + 7$$

$$= 4 \cdot (-27) - 5 \cdot 9 + 7$$

$$= -108 - 45 + 7$$

$$= -146$$

Polynomial Functions

Adding and Subtracting Functions

Adding and Subtracting Functions

If $f(x)$ and $g(x)$ define functions, then

$$(f + g)(x) = f(x) + g(x) \quad \text{Sum function}$$

and

$$(f - g)(x) = f(x) - g(x). \quad \text{Difference function}$$

In each case, the domain of the new function is the intersection of the domains of $f(x)$ and $g(x)$.

Polynomial Functions

EXAMPLE

Adding and Subtracting Functions

For the polynomial functions defined by

$$f(x) = 2x^2 - 3x + 4 \quad \text{and} \quad g(x) = x^2 + 9x - 5,$$

find **(a)** the sum and **(b)** the difference.

$$\text{(a)} \quad (f + g)(x) = f(x) + g(x) \quad \text{Use the definition.}$$

$$= (2x^2 - 3x + 4) + (x^2 + 9x - 5) \quad \text{Substitute.}$$

$$= 3x^2 + 6x - 1 \quad \text{Add the polynomials.}$$

$$\text{(b)} \quad (f - g)(x) = f(x) - g(x) \quad \text{Use the definition.}$$

$$= (2x^2 - 3x + 4) - (x^2 + 9x - 5) \quad \text{Substitute.}$$

$$= x^2 - 12x + 9 \quad \text{Add.}$$

Polynomial Functions

EXAMPLE

Adding and Subtracting Functions

For the polynomial functions defined by

$$f(x) = 4x^2 - x \quad \text{and} \quad g(x) = 3x,$$

find each of the following.

(a) $(f + g)(5)$

$$(f + g)(5) = f(5) + g(5) \quad \text{Use the definition.}$$

$$= [4(5)^2 - 5] + 3(5) \quad \text{Substitute.}$$

$$= 110$$

Polynomial Functions

EXAMPLE

Adding and Subtracting Functions

For the polynomial functions defined by
 $f(x) = 4x^2 - x$ and $g(x) = 3x$,
find each of the following.

(a) $(f + g)(5)$

Alternatively, we could first find $(f + g)(x)$.

$$(f + g)(x) = f(x) + g(x)$$

Use the definition.

$$= (4x^2 - x) + 3x$$

Substitute.

$$= 4x^2 + 2x$$

Polynomial Functions

EXAMPLE

Adding and Subtracting Functions

For the polynomial functions defined by

$$f(x) = 4x^2 - x \quad \text{and} \quad g(x) = 3x,$$

find each of the following.

(b) $(f - g)(x)$ and $(f - g)(3)$

$$(f - g)(x) = f(x) - g(x)$$

Use the definition.

$$= (4x^2 - x) - 3x$$

Substitute.

$$= 4x^2 - 4x$$

Combine like terms.

Then,

$$(f - g)(3) = 4(3)^2 - 4(3) = 24.$$

Substitute.

Confirm that $f(3) - g(3)$ gives the same result.

A power function of degree n is a function of the form

Core Concept

Parent Functions for Square Root and Cube Root Functions

The parent function for the family of square root functions is $f(x) = \sqrt{x}$.

Domain: $x \geq 0$, Range: $y \geq 0$

The parent function for the family of cube root functions is $f(x) = \sqrt[3]{x}$.

Domain and range: All real numbers

Exponential Functions

- A polynomial function has the basic form: $f(x) = x^3$
- An exponential function has the basic form: $f(x) = 3^x$
- An exponential function has the variable in the exponent, not in the base.
- General Form of an Exponential Function:
$$f(x) = N^x, N > 0$$

The Number e

A base often associated with exponential functions is:

$$e \approx 2.71828169$$

The Exponential Function

$$f(x) = e^x$$

Rational Functions

Rational functions are quotients of polynomial functions. This means that rational functions can be expressed as

$$f(x) = \frac{p(x)}{q(x)}$$

where $p(x)$ and $q(x)$ are polynomial functions and $q(x) \neq 0$. The **domain** of a rational function is the set of all real numbers except the x -values that make the denominator zero. For example, the domain of the rational function

$$f(x) = \frac{x^2 + 7x + 9}{x(x - 2)(x + 5)}$$

This is $p(x)$.

This is $q(x)$.

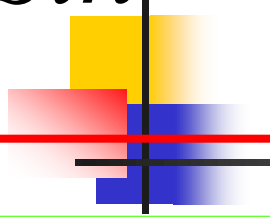

is the set of all real numbers except 0, 2, and -5.

Definition: Logarithmic Function

- For $x > 0$, $b > 0$ and b not equal to 1 the logarithm of x with base b is defined by the following:

$$\log_b x = y \Leftrightarrow x = b^y$$

$$\sin = \frac{\text{Opp Leg}}{\text{Hyp}}$$

$$\cos = \frac{\text{Adj Leg}}{\text{Hyp}}$$

$$\tan = \frac{\text{Opp Leg}}{\text{Adj Leg}}$$

Inverse Trigonometric Function

- $y = \sin x$ has a unique inverse function called the **inverse sine function**. It is denoted by
- $y = \arcsin x$ or $y = \sin^{-1} x$.
- The notation $\sin^{-1} x$ is consistent with the inverse function notation $f^{-1}(x)$.

When we are trying to find a
side

we use \sin , \cos , or \tan .

When we are trying to find an
angle

we use \sin^{-1} , \cos^{-1} , or \tan^{-1} .

Special Functions

Evaluating Piecewise Functions

- Piecewise functions are functions defined by **at least two equations**, each of which applies to a different part of the domain
- A piecewise function

$$f(x) := \begin{cases} x + 3 & x > 0 \\ 2x - 1 & x \leq 0 \end{cases}$$

Step Functions

Looks like a flight of stairs

An example of a step function:

$$f(x) = \begin{cases} 0, & \text{if } 0 \leq x < 1 \\ 1, & \text{if } 1 \leq x < 2 \\ 2, & \text{if } 2 \leq x < 3 \end{cases}$$

Graphically, the equation would look like this:

Absolute Value Function is a Piecewise Function

$$\text{Graph of } f(x) = |x| = \begin{cases} x, & x \geq 0 \\ -x, & x < 0 \end{cases}$$

Domain: $(-\infty, \infty)$

Range: $[0, \infty)$

Intercept: $(0, 0)$

Decreasing on $(-\infty, 0)$

Increasing on $(0, \infty)$

Greatest Integer Function

The **greatest integer function**, usually written $f(x) = \lfloor x \rfloor$, is defined as follows:

$\lfloor x \rfloor$ denotes the largest integer that is less than or equal to x .

For example,

$$\lfloor 9 \rfloor = 9, \quad \lfloor -3.8 \rfloor = -4, \quad \lfloor 5.7 \rfloor = 5.$$

Additional Graphs of Functions; Composition

EXAMPLE

Graphing the Greatest Integer Function

Graph $f(x) = \llbracket x \rrbracket$.

For $\llbracket x \rrbracket$,

if $-1 \leq x < 0$, then $\llbracket x \rrbracket = -1$;

if $0 \leq x < 1$, then $\llbracket x \rrbracket = 0$;

if $1 \leq x < 2$, then $\llbracket x \rrbracket = 1$,

and so on.

The appearance of the graph is the reason that this function is called a **step function**.

Additional Graphs of Functions; Composition

Composition of Functions

Composition of Functions

If f and g are functions, then the **composite function**, or **composition**, of g and f is defined by

$$(g \circ f)(x) = g(f(x))$$

for all x in the domain of f such that $f(x)$ is in the domain of g .

Additional Graphs of Functions; Composition

EXAMPLE

Evaluating a Composite Function

Let $f(x) = 3x^2 + 5$ and $g(x) = x - 7$. Find $(f \circ g)(2)$.

$$(f \circ g)(2) = f(g(2)) \quad \text{Definition}$$

$$= f(2 - 7) \quad \text{Use the rule for } g(x); g(2) = 2 - 7.$$

$$= f(-5) \quad \text{Subtract.}$$

$$= 3(-5)^2 + 5 \quad \text{Use the rule for } f(x); f(-5) = 3(-5)^2 + 5.$$

$$= 80$$

Additional Graphs of Functions; Composition

EXAMPLE

Evaluating a Composite Function

Let $f(x) = 3x^2 + 5$ and $g(x) = x - 7$. Now find $(g \circ f)(2)$.

$$(g \circ f)(2) = g(f(2)) \quad \text{Definition}$$

$$= g(3(2)^2 + 5) \quad \text{Use the rule for } f(x); f(2) = 3(2)^2 + 5.$$

$$= g(17) \quad \text{Square, multiply, and then add.}$$

$$= 17 - 7 \quad \text{Use the rule for } g(x); g(17) = 17 - 7.$$

$$= 10$$

Additional Graphs of Functions; Composition

EXAMPLE

Evaluating a Composite Function

Let $f(x) = 3x^2 + 5$ and $g(x) = x - 7$. Notice that $(f \circ g)(2) \neq (g \circ f)(2)$.

$$(f \circ g)(2) = f[g(2)]$$

$$= f(2 - 7)$$

$$= f(-5)$$

$$= 3(-5)^2 + 5$$

$$= 80$$

$$(g \circ f)(2) = g[f(2)]$$

$$= g(3(2)^2 + 5)$$

$$= g(17)$$

$$= 17 - 7$$

$$= 10$$

In general, $(f \circ g)(2) \neq (g \circ f)(2)$.

Additional Graphs of Functions; Composition

EXAMPLE

Finding Composite Functions

Let $f(x) = 5x + 1$ and $g(x) = x^2 - 4$. Find each of the following.

(a) $(f \circ g)(-3)$

$$(f \circ g)(-3) = f[g(-3)]$$

$$= f((-3)^2 - 4) \qquad g(x) = x^2 - 4$$

$$= f(5)$$

$$= 5(5) + 1 \qquad f(x) = 5x + 1$$

$$= 26$$

Additional Graphs of Functions; Composition

EXAMPLE

Finding Composite Functions

Let $f(x) = 5x + 1$ and $g(x) = x^2 - 4$. Find each of the following.

(b) $(f \circ g)(n)$

$$(f \circ g)(n) = f[g(n)]$$

$$= f(n^2 - 4)$$

$$g(x) = x^2 - 4$$

$$= 5(n^2 - 4) + 1$$

$$f(x) = 5x + 1$$

$$= 5n^2 - 19$$

Additional Graphs of Functions; Composition

EXAMPLE

Finding Composite Functions

Let $f(x) = 5x + 1$ and $g(x) = x^2 - 4$. Find each of the following.

(c) $(g \circ f)(n)$

$$(g \circ f)(n) = g[f(n)]$$

$$= g(5n + 1)$$

$$f(x) = 5x + 1$$

$$= (5n + 1)^2 - 4$$

$$g(x) = x^2 - 4$$

$$= 25n^2 + 10n + 1 - 4$$

$$= 25n^2 + 10n - 3$$

Intro to Inverses

- A function describes the relationship between 2 variables, applying a rule to an input that generates exactly one output.
- For such relationships, we are often compelled to “reverse” or “undo” the rule.

Progress of Inverses Throughout Math

- Learned Addition and then its inverse operation Subtraction.
- Learned Multiplication and then its inverse operation Division.
- Learning Perfect Squares connects with extracting Square Roots
- **Basically – Inverses are a second operation that reverses the first one!**

Inverse of a relation

- The inverse of the ordered pairs (x , y) is the set of all ordered pairs (y , x).
- The Domain of the function is the range of the inverse and the Range of the function is the Domain of the inverse.
- Symbol: $f^{-1}(x)$ **In other words, switch the x's and y's!**

Example: $\{(1,2), (2, 4), (3, 6), (4, 8)\}$

Inverse:

$$\{(2,1), (4,2), (6,3), (8,4)\}$$

To find an inverse...

- Switch the x 's and y 's.
- Solve for y .
- Change to functional notation.

Find Inverse:

$$f(x) = 8x - 1$$

$$f(x) = 8x - 1$$

$$y = 8x - 1$$

$$x = 8y - 1$$

$$8y = x + 1$$

$$y = \frac{x + 1}{8}$$

$$f^{-1}(x) = \frac{x + 1}{8}$$

Find Inverse: $f(x) = 8x - 2$

$$f(x) = 8x - 2$$

$$y = 8x - 2$$

$$x = 8y - 2$$

$$8y = x + 2$$

$$y = \frac{x + 2}{8}$$

$$f^{-1} = \frac{x + 2}{8}$$

Find Inverse:

$$f(x) = \frac{3x + 1}{2}$$

$$f(x) = \frac{3x + 1}{2}$$

$$y = \frac{3x + 1}{2}$$

$$x = \frac{3y + 1}{2}$$

$$3y + 1 = 2x$$

$$3y = 2x - 1$$

$$y = \frac{2x - 1}{3}$$

$$f^{-1} = \frac{2x - 1}{3}$$

Find Inverse:

$$f(x) = x^2 + 4$$

$$f(x) = x^2 + 4$$

$$y = x^2 + 4$$

$$x = y^2 + 4$$

$$y^2 = x - 4$$

$$y = \sqrt{x - 4}$$

$$f^{-1}(x) = \pm \sqrt{x - 4}$$

Draw the inverse. Compare to the line $y = x$. What do you notice?

$(-5, 3)$
 $(-4, 2)$
 $(-3, 1)$
 $(-2, 1)$
 $(-1, 1)$
 $(0, 1)$
 $(1, 5)$

$(3, -5)$
 $(2, -4)$
 $(1, -3)$
 $(1, -2)$
 $(1, -1)$
 $(1, 0)$
 $(5, 1)$

Graph the inverse of the following:

x	y
0	-5
-3	-4
1	2
1	4

The function and its inverse are symmetric with respect to the Line $y = x$.

Things to note..

- The domain of $f^{-1}(x)$ is the range of $f(x)$.
- The graph of an inverse function can be found by reflecting a function in the line $y=x$.

Check this by plotting $y = 3x + 1$ and

$$y = \frac{x-1}{3}$$

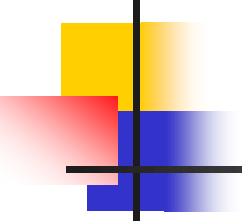

Take a look

Reflecting..

Find the inverse of the function.

$$f(x) = \sqrt{x}$$

$$\begin{aligned}x &= \sqrt{y} \\x^2 &= (\sqrt{y})^2 \\y &= x^2\end{aligned}$$

Is the inverse also a function? Let's look at the graphs.

$$\begin{aligned}\text{If } f(x) &= x^2, \\x &= y^2 \\ \sqrt{x} &= \sqrt{y^2} \\ y &= \pm\sqrt{x}\end{aligned}$$

← Inverse

Is it an Inverse?

A function can only have an inverse if it is one-to-one.

You can use the horizontal line test on graphical representations to see if the function is one-to-one.

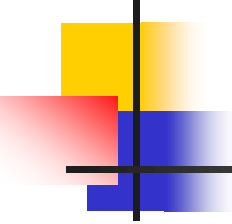

Composition and Inverses

- If f and g are functions and

$$(f \circ g)(x) = (g \circ f)(x) = x,$$

then f and g are inverses of one another.

Example: Show that the following are inverses of each other.

$$f(x) = 7x - 2 \text{ and } g(x) = \frac{1}{7}x + \frac{2}{7}$$

$$\begin{aligned}(f \circ g)(x) &= 7\left(\frac{1}{7}x + \frac{2}{7}\right) - 2 \\ &= x + 2 - 2 \\ &= x\end{aligned}$$

$$\begin{aligned}(g \circ f)(x) &= \frac{1}{7}(7x - 2) + \frac{2}{7} \\ &= x - \frac{2}{7} + \frac{2}{7} \\ &= x\end{aligned}$$

The composition of each both produce a value of x; Therefore, they are inverses of each other.

Are f & g inverses?

$$f(x) = x^3 - 4$$

$$g(x) = \sqrt[3]{x+4}$$

$$\begin{aligned}(f \circ g)(x) &= \left(\sqrt[3]{x+4}\right)^3 - 4 \\ &= x + 4 - 4 \\ &= x\end{aligned}$$

$$\begin{aligned}(g \circ f)(x) &= \sqrt[3]{x^3 - 4 + 4} \\ &= \sqrt[3]{x^3} \\ &= x\end{aligned}$$

YES!

You Try....

- Show that

$$f(x) = 4x - 3 \text{ and } g(x) = \frac{1}{4}x + \frac{3}{4}$$

- are inverses of each other.

$$(f \circ g)(x) = (g \circ f)(x) = x$$

*Therefore, they ARE
inverses of each other.*

Are f & g inverses?

$$f(x) = 3x - 2$$

$$g(x) = \frac{x+2}{3}$$

$$\begin{aligned}(f \circ g)(x) &= 3\left(\frac{x+2}{3}\right) - 2 \\ &= x + 2 - 2 \\ &= x\end{aligned}$$

$$\begin{aligned}(g \circ f)(x) &= \frac{3x - 2 + 2}{3} \\ &= \frac{3x}{3} \\ &= x\end{aligned}$$

YES!
